Dear Hiring Team,

Re: Field Support / Test & Validation Engineer (Hardware-Assisted Verification), Synopsys

I am applying for the Field Support role in your Hardware-Assisted Verification (HAV) team. I am a mechanical engineer with eight years in test, validation and customer-facing support, and I want to build the next stage of my career around hands-on hardware work at customer sites.

I will be honest about my gaps first: my experience so far is in automotive electronics, test rigs and automated driving simulation rather than semiconductor emulation or prototyping hardware, and while I have used Linux as my main workstation for five years and write Python tools, I have not written bash or tcsh scripts beyond everyday terminal use. I learn new hardware and tools quickly, and I enjoy getting into the lab to understand how a system fits together.

At AVL I spent two years on-site at Jaguar Land Rover as feature owner for three corner-radar features, running tests in vehicles and on the proving ground, supporting AVL's DrivingCube ViL test bed, and working between the customer, AVL and the hardware supplier. When a module failed to activate in vehicle tests, I read the fault codes, checked fuses, and powered modules on a 12 V bench supply to find the cause. At the LEVC (London Taxi) factory I inspected about 20 returned faulty range-extender generators, carrying out multimeter checks at connector pins, powering the control unit from a bench supply to download logs with the supplier's tool, and sending the data and reports to the supplier for root cause analysis.

At FiveAI / Bosch I trained Volkswagen Group partner engineers on our simulation toolchain and was a founding member of the Simulation EcoSystem solutions team. I diagnosed problems across partners' toolchains and tools from the error logs between APIs and simulation, worked in Linux in a dev container, used SSH to reach our GPU cluster, and built Python tools and reporting pipelines across more than 1,000 hours of test data. Outside work I build my own desktop PCs (chassis prep, mounting boards and parts, cabling), repair my own cars with a multimeter and workshop manuals, and at university our team designed, built and wired a 6-DOF motion platform in SolidWorks, MATLAB and Arduino.

Following Volkswagen Group's withdrawal from the project, my role at Bosch ended by redundancy today, so I am immediately available. I hold British and Turkish citizenship, have a full UK driving licence, and am happy to travel across the UK and internationally. Thank you for reading, and I would welcome the chance to talk about the role.

Yours sincerely,

Muhammet Celal Gokalp
